

## Nanjee Dynamic Data Base (DDB)

The Nanjee IP data base is managed internally and does not rely on third party data providers. We use a dynamic method to ensure the IP database remains current; IP addresses are sent for refresh within Nanjee's IP Geolocation system as per the profile of their known location-change frequency e.g. daily, every other day etc. Updated new IP locations are instantly available in the IP Geolocation database from which clients are served.

## Real Time

Real Time IP Geolocation is a unique, premium service that Nanjee also provides that is not available anywhere else in the market. This service enables a client's IP request to be directly sent to the Nanjee live IP Geolocation system from which the result is then served directly to a client and not served from the database. Such approach further increases data accuracy due to high location change frequency of dynamic IP addresses.

## Capturing IPs location change dynamics during 2 weeks

Nanee is a user independent technology that does not intrude privacy. The technology provides clients with an IP address location within **0.7 miles** on average. Accuracy results continue to improve as more IP landmarks are added to the database.

**Contact Nanjee NOW** - Our teams in Europe and North America are ready to initiate a pilot test.
